30	Reported Cases of Reportable Diseases: Montana Counties, 1978 (By place of residence) .	72-73

INTRODUCTION

This report is designed to provide a ready reference to some of the more frequently used vital statistics for Montana. Since the report is primarily intended for reference, little space has been devoted to analysis and interpretation of the data. Where space permits, 1978 data are accompanied by figures for the previous year or years so that comparisons may be made. Only information of general interest is published here. In most cases, more detailed data are available upon request.

Records collected by the Montana Department of Health and Environmental Sciences provide the basis for the tabulations in this report. These records include certificates of birth, death, and fetal death (stillbirth) and transcripts showing information on marriage, marital dissolutions, morbidity, and legally induced abortion.

LIMITATIONS OF THESE DATA

Delay in Filing

This report includes all 1978 vital records received before May 15, 1979. The number of records received after this date is so small that in most instances, it is of little consequence.

Geographic Allocation

Births and deaths may be tabulated by place of occurrence or by place of residence. For deaths, the place of residence is the usual residence of the decendent. For births, the place of residence of the child is the same as the mother's.

Residence data are tabulated by using a system of exchange of certificates with other states and the provinces of Canada. Titles of tables in this report indicate whether the data are shown by residence or occurrence.

Deaths in hospitals, sanatoria, and other institutions are allocated to the decedent's place of previous residence regardless of his length of stay in the institution. This affects the rates for counties with state institutions. For census enumeration purposes, persons living in such institutions are considered to be residents of the county where the institution is located. For vital statistics purposes, they are considered to be residents of the county where they resided prior to entering the institution. Rates for Deer Lodge County are most affected by this conflict in method.

Medical Certification

Causes of death reported on death certificates are classified according to the Eighth Revision of the International Classification of Diseases, Adapted for Use in the United States (I.C.D.A.). The objective of the coding procedures used in this classification is to state as the cause of death the condition the attending physician or coroner considered to be the underlying cause.

The medical certification section of the Montana Death Certificate asks for information on the casual and chronological sequence of events leading to death. It consists of two parts with space for indicating the interval between onset and death for each condition. Part I is used for reporting the causes leading directly to death. Part II is for reporting any other important diseases or conditions that influenced the course of the illness unfavorably, thus contributing to the fatal outcome but which were not related to the disease or condition reported as the immediate cause of death. To illustrate, a medical certification might read as follows:

Part I. Death was caused by:
Immediate cause (a) postoperative bronchial pneumonia
Due to (b) lobectomy
Due to (c) primary cancer of lung

Part II.
Hypertensive cardiovascular disease

This death would be assigned to I.C.D.A. rubric 162.1 (malignant neoplasm of bronchus and lung).

Deaths are classified in this way whenever possible. However, exceptions must be made when the underlying cause is not apparent from the certification and when clarification cannot be secured. In these instances, a system of rules is applied to select the probable underlying cause.

Race

It is difficult to tabulate vital events by race when the persons under question are of mixed blood. The statement of race on the certificates usually reflects the opinion of the informant and does not follow any prescribed rules for the reporting of race. For the most part, racial data in this report are shown simply as "white" and "other", this minimizes confusion with concepts of nationality, country of origin of parents, or other characteristics. In the racial classification used, white includes "Mexican."

Legitimacy

The Montana Certificate of Live Birth does not contain an item regarding the legitimacy of the child. The rules of the Montana Department of Health and Environmental Sciences require: "If the mother was not married at the time of birth, and had not been married within ten months of the birth the name of the father must not be entered on the certificate of birth unless accompanied by the written consent of both the mother and the father."

Births are inferred to be illegitimate if information regarding the father is omitted. They are also classified as out-of-wedlock if they are accompanied by the required affidavits when information regarding the father is shown. Individual consideration is given certificates where the surname used in the mother's signature does not agree with the surname of the father.

Limitations of Small Numbers

The occurrence of events recorded in this publication is subject to chance variation. For example, an

infant death at 11:59 P.M. on December 31 would be counted in one year, however, if the infant lived only two minutes longer and died at 12:01, the death would be counted in the following year. This phenomenon is not of great importance for counties with substantial populations since the relative number of infant deaths will not be greatly affected by one event. In the case of counties with small populations, the occurrence of even one event may produce a rate which is well above the average for the state.

When the number of events is displayed, the occurrence of small numbers is obvious. However, when rates or percentages are shown, the fact that they may be based on small numbers of events may not be immediately apparent.

In some instances an attempt is made to ameliorate the problem by adding data together for several years (for example, the five-year infant mortality rates shown in Table 13). However, use of multiyear rates in these tables has been limited because such rates often conceal changes in trends within the period under scrutiny.

Population Estimates

County population estimates are provided by the Bureau of Business and Economic Research of the University of Montana. These estimates are produced in cooperation with the United States Bureau of the Census.

Definitions

Following are definitions of selected terms as they are used in this publication:

ABORTION - A legal act or operation intended to terminate a pregnancy without live birth, which is reported to the Department.

CRUDE BIRTH RATE - relates the number of live births to the total population. It is computed as follows:

$$\text{Annual crude birth rate} = \frac{\text{Annual number of live births}}{\text{Midyear population}} \times 1{,}000$$

CRUDE DEATH RATE - relates the number of deaths to the total population. It is computed as follows:

$$\text{Annual crude death rate} = \frac{\text{Annual number of deaths}}{\text{Midyear population}} \times 1{,}000$$

FERTILITY RATE - relates total births to an approximation of the population exposed to risk. The denominator is limited to women in the main childbearing ages. It is computed as follows:

$$\text{Annual general fertility rate} = \frac{\text{Annual number of live births}}{\text{Midyear population of women]5 - 44 years of age}} \times 1{,}000$$

FETAL DEATH - the birth of a fetus after 20 weeks of gestation which shows no evidence of life after complete birth (this is, no action of the heart, breathing, or movement of voluntary muscles).

FETAL MORTALITY RATIO - relates fetal deaths to live births. It is computed as follows:

$$\text{Annual fetal mortality ratio} = \frac{\text{Annual number of fetal deaths}}{\text{Annual number of live births}} \times 1{,}000$$

FIVE-YEAR INFANT MORTALITY RATE - relates the number of deaths under 1 year of age to the number of live births. It is calculated as follows:

$$\text{Five-year infant mortality rate} = \frac{\text{Number of deaths under 1 year of age over a five-year period}}{\text{Number of live births over the same five-year period}} \times 1{,}000$$

ILLEGITIMACY RATIO - relates out-of-wedlock live births to total live births. It is computed as follows:

$$\text{Annual illegitimacy ratio} = \frac{\text{Annual number of illegitimate live births}}{\text{Annual number of all live births}} \times 1{,}000$$

INFANT DEATH - the death of a person under 1 year of age.

LIVE BIRTH - birth of a child who shows evidence of life after complete birth. Evidence of life includes heart action, breathing, or movement of voluntary muscles.

MATERNAL MORTALITY RATE - measures the risk of death from deliveries and complications of pregnancy, childbirth, and the puerperium. It is computed as follows:

$$\text{Annual maternal mortality rate} = \frac{\text{Annual number of deaths attributed to maternal conditions}}{\text{Annual number of live births}} \times 100{,}000$$

NATURAL INCREASE - is the excess of births over deaths among residents of an area. The rate shown per 1,000 population in the area.

$$\text{Annual rate of natural increase} = \frac{\text{Annual number of live births minus annual number of deaths}}{\text{Population of area}} \times 1{,}000$$

NEONATAL DEATH - the death of an infant under 28 days of age.

OCCURRENCE - where an event takes place regardless of the usual residence of the person involved.

PERINATAL DEATHS - are those occurring around the time of birth. They are made up of the sum of registered fetal deaths and neonatal deaths.

PERINATAL MORTALITY RATE - relates the number of fetal deaths plus neonatal deaths to the number of deliveries (fetal deaths plus live births). It is calculated as follows:

$$\text{Perinatal Mortality Rate} = \frac{\text{Annual number of fetal deaths plus neonatal deaths}}{\text{Annual number of fetal deaths plus live births}} \times 1{,}000$$

PREMATURE (IMMATURE) INFANT - a live born infant with a birth weight of five (5) pounds eight (8) ounces (2,500) grams or less.

RESIDENCE - for deaths, this refers to the usual residence of the decedent. For births and fetal deaths, it refers to the usual residence of the mother.

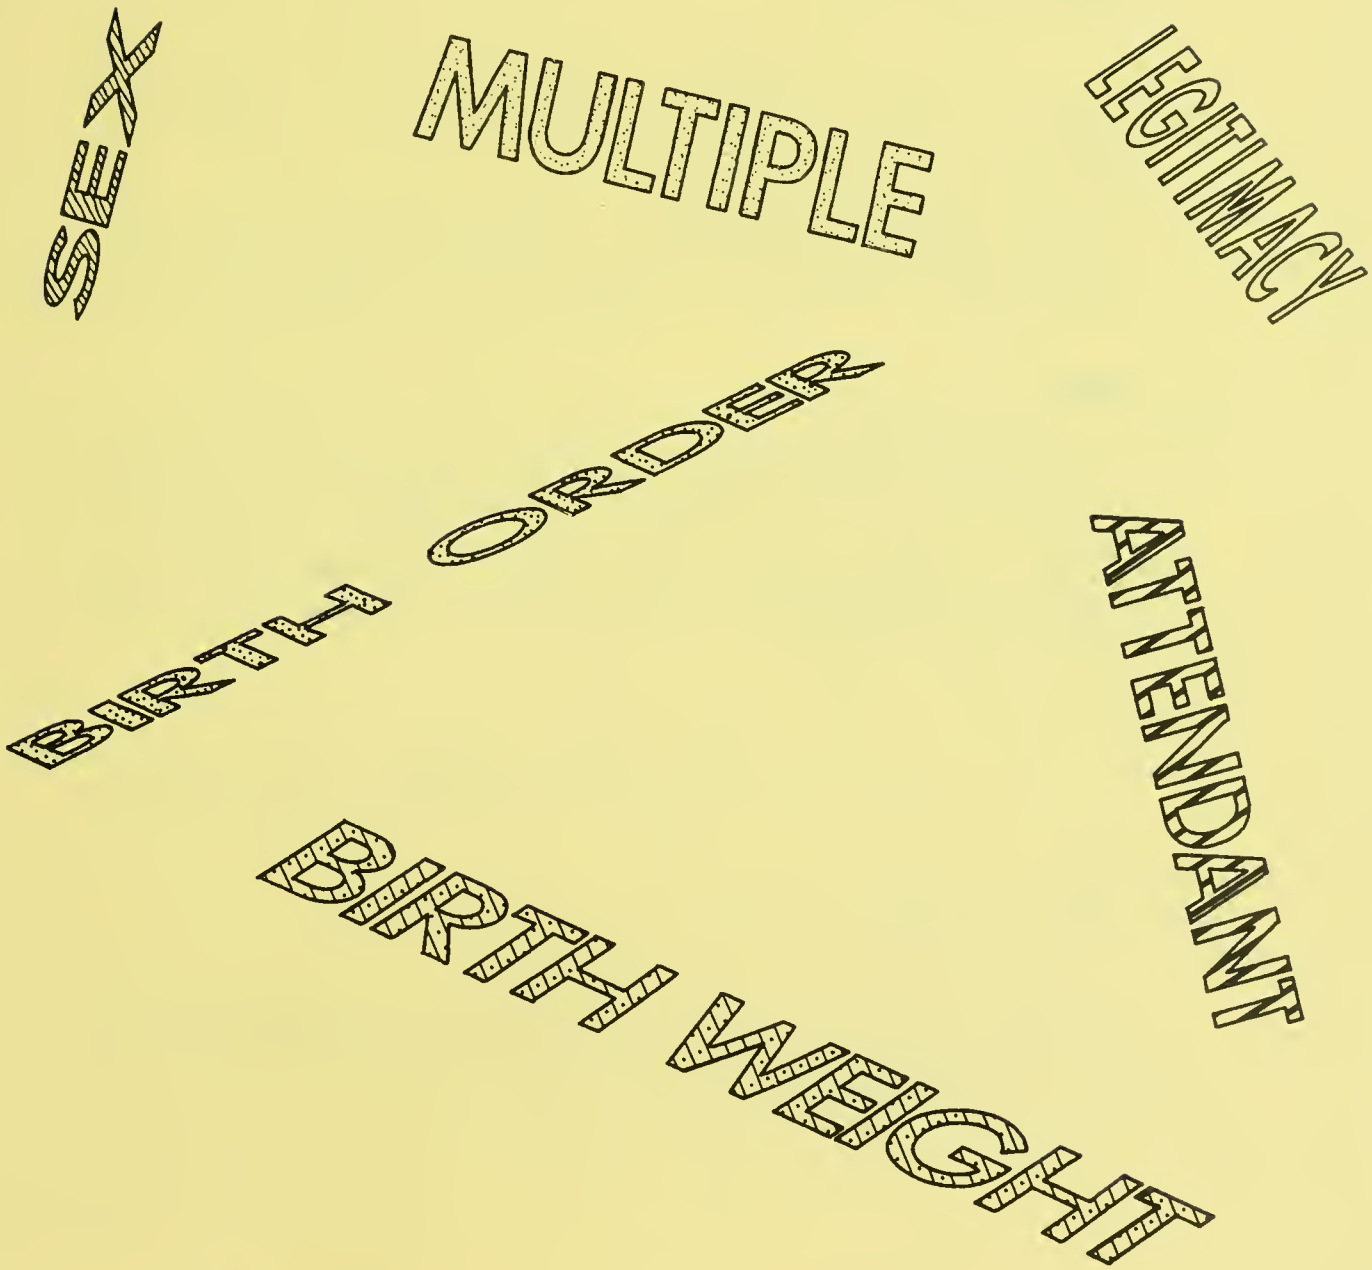
BIRTHS



EDUCATION OF MOTHER

BIRTHS

The Montana birth rate continued to exceed that for the United States as a whole. The provisional crude birth rate for the United States in 1978 was 15.3, compared with Montana's rate of 17.3 births per 1,000 population.

The 13,545 resident births meant that a baby was born to a Montana resident every 39 minutes in 1978, resulting in a natural increase (excess of births over deaths) of 7,061 persons.

The highest incidence of births occurred during the months of April and May (an average 39 per day) while the lowest occurred in December (an average 35 births per day).

TREND

The crude resident birth rate has varied between 15.8 and 18.2 since 1970. With the exception of 1974, the number of live births per year has been increasing steadily since 1973. Despite the numerical increase in births, the crude birth rates (births per 1,000 population) remained stable because the population base has also increased.

SEX RATIO

Sex ratio is the number of male births per 100 female births. For the period 1970-1978, the average for the period was 106. The ratio stood in 1978 at 109.1.

MULTIPLE BIRTHS

There were 266 twins born alive to mothers who were Montana residents. Of these, 264 were accounted for by 132 sets of live-born twins. Only two were for a live-born infant where the twin was born dead.

Of the 266 live-born twins, 238 were white (1.9 percent of white births), and 28 were Indian (2.2 percent of Indian births).

The sex ratio for multiple births was 146, much higher than the sex ratio for all births in 1978, 109. Of the twins, 158 were males, and 108 were females.

No triplets were born in Montana in 1978.

RACE

There were proportionally more births to Indian mothers than to white. The 1970 census showed that 3.9 percent of Montana's population was Indian. However, 9.4 percent of the 1978 births were Indian.

MONTH PRENATAL CARE BEGAN

Montana mothers had a relatively good record of seeking medical care early in pregnancy. More than three out of four (78.1 percent) sought medical care in the first trimester of pregnancy.

COMPLICATIONS OF PREGNANCY

There were 578 certificates filed which indicated a complication of pregnancy. Toxemia was the most frequently-listed complication (319), followed by hemmorrhage (86), and other medical complications arising during pregnancy and childbirth (59).

COMPLICATIONS OF LABOR

A complication of labor was indicated on 2,802 birth certificates. Most frequently mentioned was malpresentation of fetus (462), followed by abnormality of placenta and cord (452).

CONGENITAL MALFORMATIONS

Of the 13,545 birth certificates filed, congenital malformations were indicated on 227 (1.7 percent). The most frequently-listed malformations involved the

musculoskeletal system (53), the genitourinary system (36), and the circulatory system (21).

PROPHYLAXSIS

Silver nitrate was used in the prevention of ophthalmia neonatorum in three out of four births (76.7 percent) in 1978. Antibiotics were used in about one out of five births (18.5 percent). Sulfa drugs were used in 176 births (1.3 percent), while in 108, it was indicated that no prophylaxsis was used. The item was not completed on 347 birth certificates.

OUT-OF-WEDLOCK BIRTHS

Both the number and proportion of out-of-wedlock births continued upward in Montana in 1978, setting a new record of 1,629 births for an out-of-wedlock birth rate of 120.3. The 1978 ratio was almost seven times as high as that for 1953 (17.5). The out-of-wedlock birth ratio for whites was 86.3 per 1,000 live births, for Indians 444.8, and for other races 97.6.

OCCURRENCE - RESIDENCE

More Montana mothers left the state to have their babies than non-residents came to the state to be delivered.

LIVE BIRTHS	Occurring in Montana	Occurring Out of State	Total Resident Live Births
Mother was Montana Resident	13,151	394	15,545
Mother was Non-Resident	91

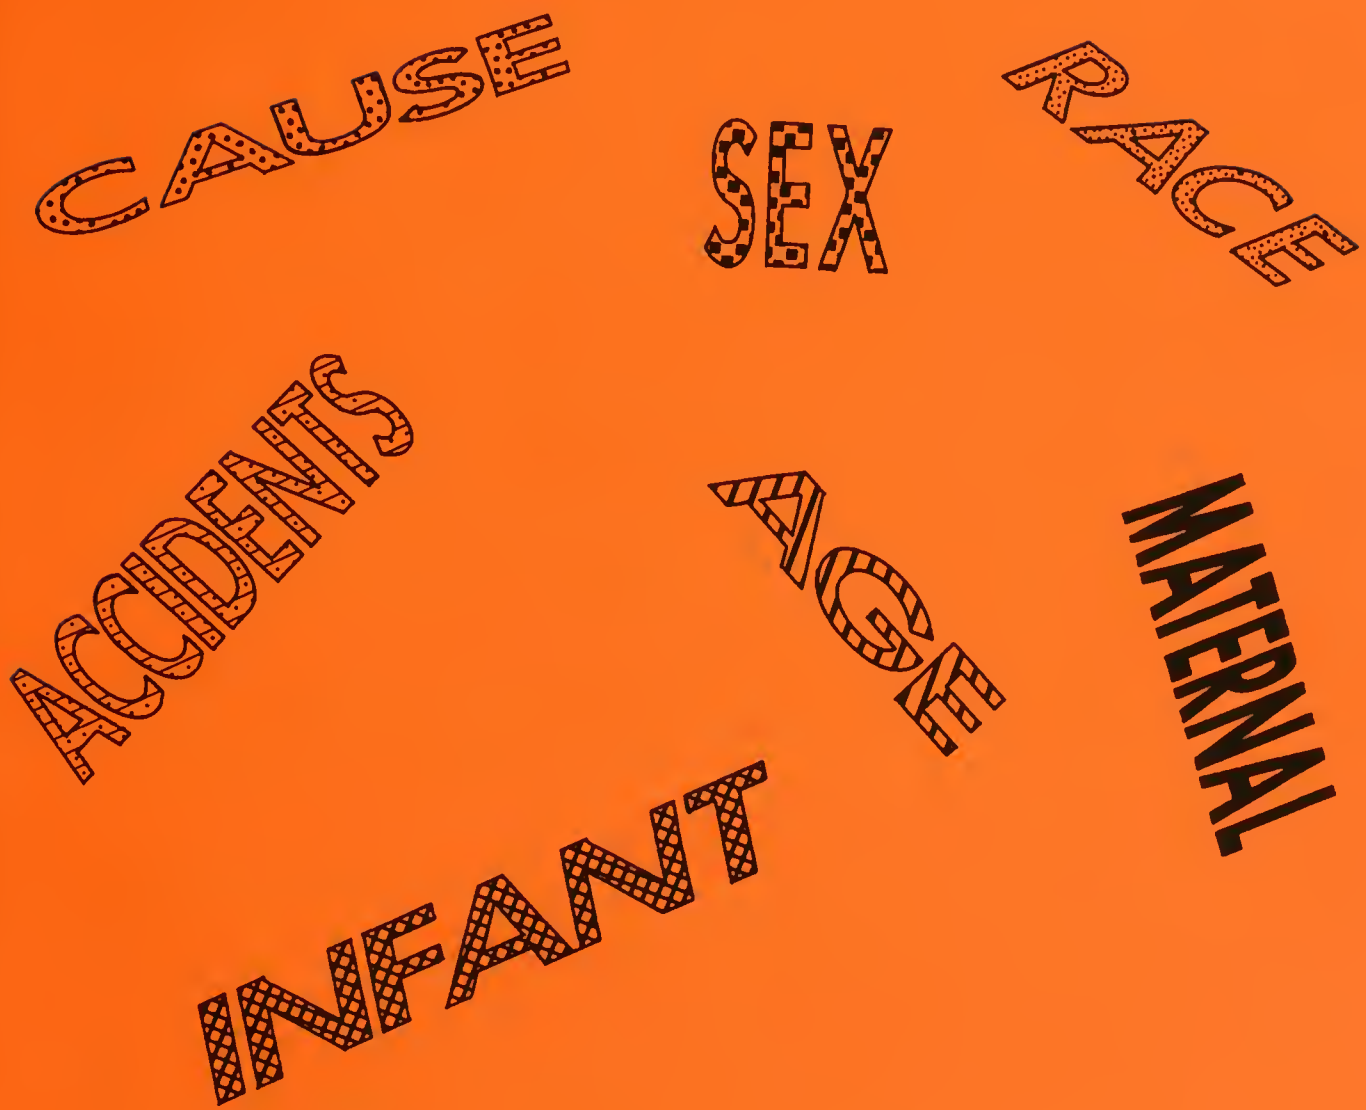
DEATHS



HISTORICAL SERIES

DEATHS

The death rate in Montana continued to drop in 1978 as it has generally done since 1943. The 6,484 deaths of Montana residents in 1978 constituted a crude death rate of 8.3 deaths per 1,000 estimated population, the lowest crude death rate ever recorded for the state. Since the actual number of deaths for 1978 exceeded the actual number of deaths for 1977, the decrease in crude death rate was due to an increased estmated population.

Of the 6,484 deaths 58 percent were male; 33 percent were attributable to heart disease, 19 percent to cancer, 9 percent to stroke, and 9 percent to accidents; 67 percent were people 65 years of age and older. The median age at death was approximately 72, relatively unchanged over the past three years.

HEART DISEASE

Even though heart disease continued its downward trend in 1978 (2,169 deaths for a cause-of-death rate of 276.3 deaths per 100,000 estimated population), it remained the leading cause of death in the state. While heart disease displayed an overall decreasing rate in Montana, it accounted for an increasing proportion of deaths in the 25- to 44-year-old age group (8 percent in 1976, 9 percent in 1977, and 11 percent in 1978).

Ischemic heart disease accounted for approximately 78 percent of all deaths due to heart disease, with the acute form of this disease, myocardial infarction, accounting for 41 percent of all heart disease deaths.

CANCER

Cancer continued as the second leading cause of death in Montana in 1978. The 1,233 cancer deaths constituted a cause-of-death rate of 157.1, which was a slight increase over the 1977 rate of 155.6.

There were 703 male deaths due to cancer, 57 percent of all cancer deaths. Twenty-eight percent of the 703 deaths were attributable to cancer of the lung while 27 percent were attributable to cancer of the digestive organs.

Of the 530 female cancer deaths, 95 (18 percent) were attributable to cancer of the breast. The breast

continued to be the most frequent site for cancer in women although the 86 female cancer deaths due to cancer of the lung represented a continuing increase in frequency.

STROKE

The number of deaths and cause-of-death rate from cerebral vascular disease continued to decrease. The 559 deaths due to these diseases constituted a cause-of-death rate of 71.2 as compared to 75.7 in 1977 and 84.6 in 1976. Cerebral vascular disease continued to be the third leading cause of death in Montana.

ACCIDENTS

Accidental deaths claimed 558 Montanans in 1978, or 8.6 percent of all 1978 deaths. This percentage was down slightly from the 9 percent of 1977. Accidents remained the fourth leading cause of death, though numerically exceeded by only one death by the third-leading cause, stroke.

Almost half of the accidental deaths (49 percent) were attributable to motor vehicle accidents. Leading among the other 51 percent of accidental deaths were various types of falls. Death-by-falling was followed in frequency by drowning deaths.

There continued to be a striking contrast between median ages in accidental death categories. The median age for accidental deaths in Montana in 1978 was 28.04 years; that for death due to motor vehicle accidents was 26.75; while that for all other (non-motor vehicle) accidents was 40.0 years.

SUICIDE, HOMICIDE, AND UNKNOWN VIOLENCE

The number of suicides of Montana residents took a downward turn in 1978 with 122 deaths for a cause-of-death rate of 15.5. This compared with a rate of 18.8 in 1977 and 17.1 in 1976.

Homicides also decreased with respect to 1977. There were 40 deaths due to homicide for a cause-of-death rate of 5.1 compared to a rate of 6.7 in 1977.

INFANT DEATHS

The lowest infant-mortality rate ever in Montana was recorded in 1978. There were 155 infant deaths in 1978, a rate of 11.4 deaths per 1,000 live births. 1978 also witnessed a decrease in the fetal death rate. The 110 fetal deaths constituted a rate of 8.1 as compared to 8.9 and 8.3 for the preceeding two years.

CHANGES IN THE WAY WE DIE

The annual preparation of this publication forces statisticians back into very recent history. Over the past forty years we observe increases, decreases, and random fluctuations in death rates, frequencies, and leading causes of death as refected in numbers, the fuel of statistics. The one thing that seems to remain constant, however, is the labels attached to cause of death. We can see the continual decrease in tuberculosis death rates, for instance, but the fact remains that tuberculosis as an entity has always been there over this entire time period. Such is the myopia of the human being, though, that if we go all the way back to London in 1632, we even find some perplexing labels. John Graunt was the statistician who presented the following mortalilty statistics for London in 1632:

- The five leading causes of death were 'Chrisomes and Infants', 'Consumption', 'Fever', 'Aged', and 'Flocks and Small Pox.'
- 15 people 'Made Away Themselves'
- .4 percent of the deaths were attributable to 'King's Evil'
- The number of people dying from 'Grief' (11) exceeded the number dying from 'Lethargie' (2).

People of today can undoubtedly be pleased that we do not see this label in Montana's death causes: "Decreased of the Plague in the 122 Parishes, and at the Pesthouse this year ..... 266."

CHART 3

PROPORTION OF DEATHS FROM MAJOR CAUSES: Montana, 1978

(By place of residence)

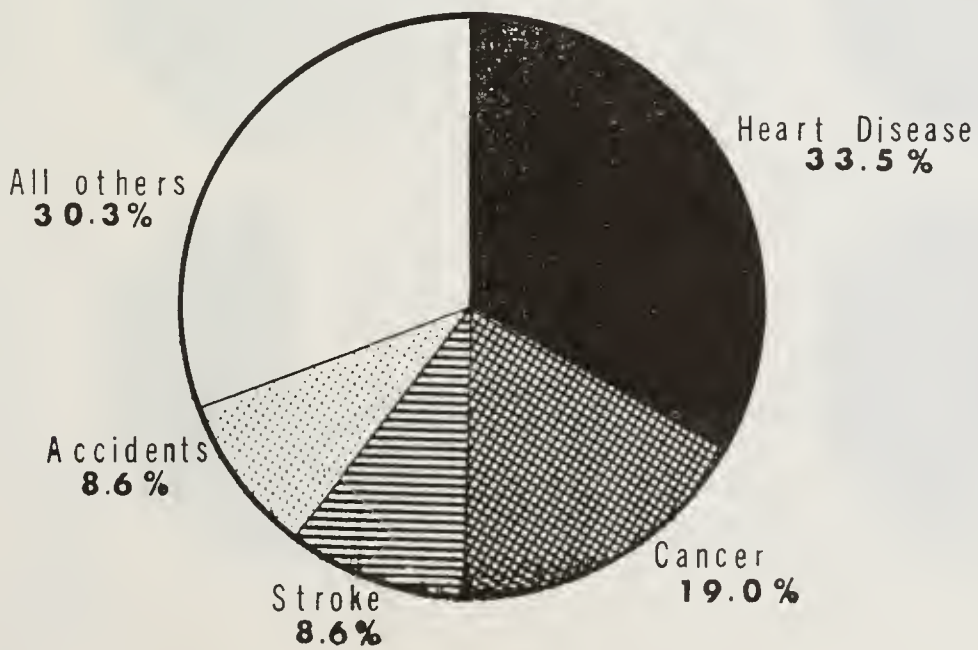

Table 10

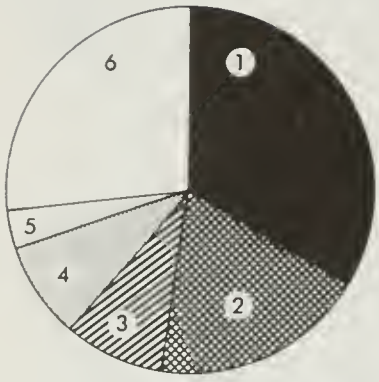
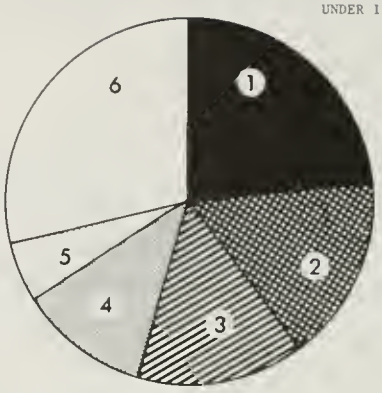
LEADING CAUSES OF DEATH BY AGE GROUP
Montana, 1978
(By Place of Residence)

ALL AGES



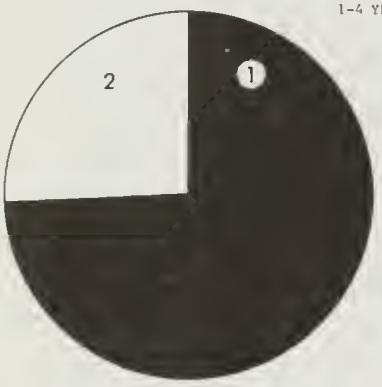
Cause of Death	Number of Deaths
1. Heart Disease	2,169
2. Cancer	1,233
3. Stroke	559
4. Accidents	558
5. Influenza & Pneumonia	218
6. Other Causes	1,747
Total Deaths	6,484

UNDER 1 YEAR



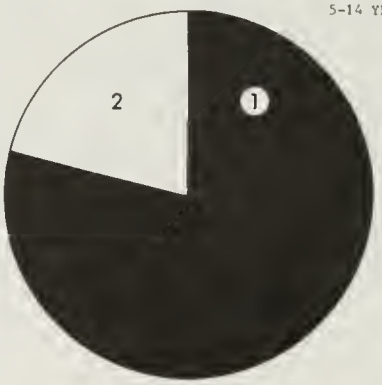
Cause of Death	Number of Deaths
1. Congenital Anomalies	36
2. Anoxia & Hypoxia	25
3. Conditions of Mother and Difficult Labor	23
4. Sudden Infant Death	18
5. External Injury	8
6. Other Causes	45
Total Deaths	155

1-4 YEARS



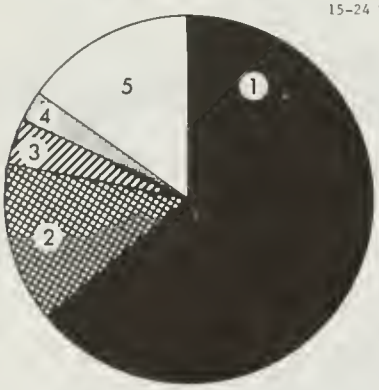
Cause of Death	Number of Deaths
1. External Injury	23
2. All Other Causes	8
Total Deaths	31

5-14 YEARS



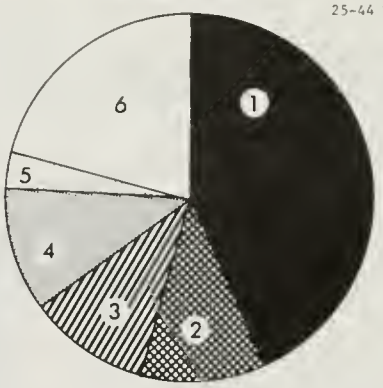
Cause of Death	Number of Deaths
1. External Injury	30
2. All Other Causes	8
Total Deaths	38

15-24 YEARS



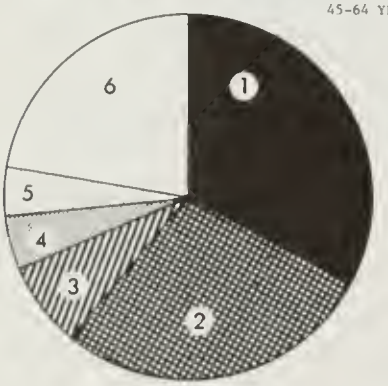
Cause of Death	Number of Deaths
1. Accidents	143
2. Suicide	32
3. Homicide	9
4. Cancer	6
5. All Other Causes	34
Total Deaths	224

25-44 YEARS



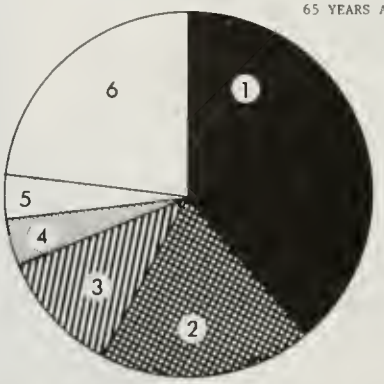
Cause of Death	Number of Deaths
1. Accidents	153
2. Cancer	39
3. Heart	38
4. Suicide	38
5. Cirrhosis of Liver	12
6. All Other Causes	74
Total Deaths	354

45-64 YEARS



Cause of Death	Number of Deaths
1. Heart Disease	442
2. Cancer	379
3. Accidents	101
4. Cirrhosis of Liver	65
5. Cerebrovascular Disease	57
6. All Other Causes	305
Total Deaths	1,349

65 YEARS AND OVER



Cause of Death	Number of Deaths
1. Heart Disease	1,683
2. Cancer	806
3. Cerebrovascular Disease	490
4. Influenza & Pneumonia	188
5. Arteriosclerosis	166
6. All Other Causes	999
Total Deaths	4,332

Age of one decedent was not stated.

TABLE 11

DEATHS FROM SELECTED ACCIDENTS BY AGE
MONTANA, 1978

BY PLACE OF OCCURRENCE. EACH PERCENT HAS BEEN INDEPENDENTLY ROUNDED TO THE NEAREST ONE-TENTH OF ONE PERCENT; HENCE, THE SUMS OF PARTS MAY DIFFER SLIGHTLY FROM THE TOTALS SHOWN.

ABORTIONS

Even though there were 3,044 legally-induced abortions reported to the Bureau of Records and Statistics for 1978, the Montana ratio of 225 abortions per 1,000 live births was substantially below that for the entire United States, at 347 per 1,000 live births.

The number of abortions reported by year were as follows:

1975	1,575
1976	1,803
1977	2,539
1978	3,044.

Reasons for the increase probably include: first, Montana facilities may have provided more abortion services to our residents in 1978 so that fewer Montanans left the state for the procedure. A second reason may have been that reporting improved, and third, more Montana residents may have had abortions, particularly teenagers who did not know where to get an illegal abortion when legal abortions were not available here.

On a national basis, there was little illness reported as a result of illegal abortions, and it seems that there were relatively few criminal procedures performed over the years cited. This also appears to be the case for Montana.

The typical woman aborted in Montana in 1978 was white, a Montana resident, single, age 18, a high school graduate with no living children, and pregnant for the first time. In most instances, she had been pregnant nine weeks or less, and her pregnancy was terminated by suction curettage. Typically, the procedure was performed in a clinic, and she did not experience any medical complications.

Almost all abortions performed in Montana involved Montana residents. In 1978, 2,927 (96.2 percent) were Montana residents. Other areas with eight or more residents being aborted in Montana were located nearby: Wyoming, 52 ;Idaho, 17; Canada, 17; North Dakota, 8.

MARRIAGE AND DIVORCE

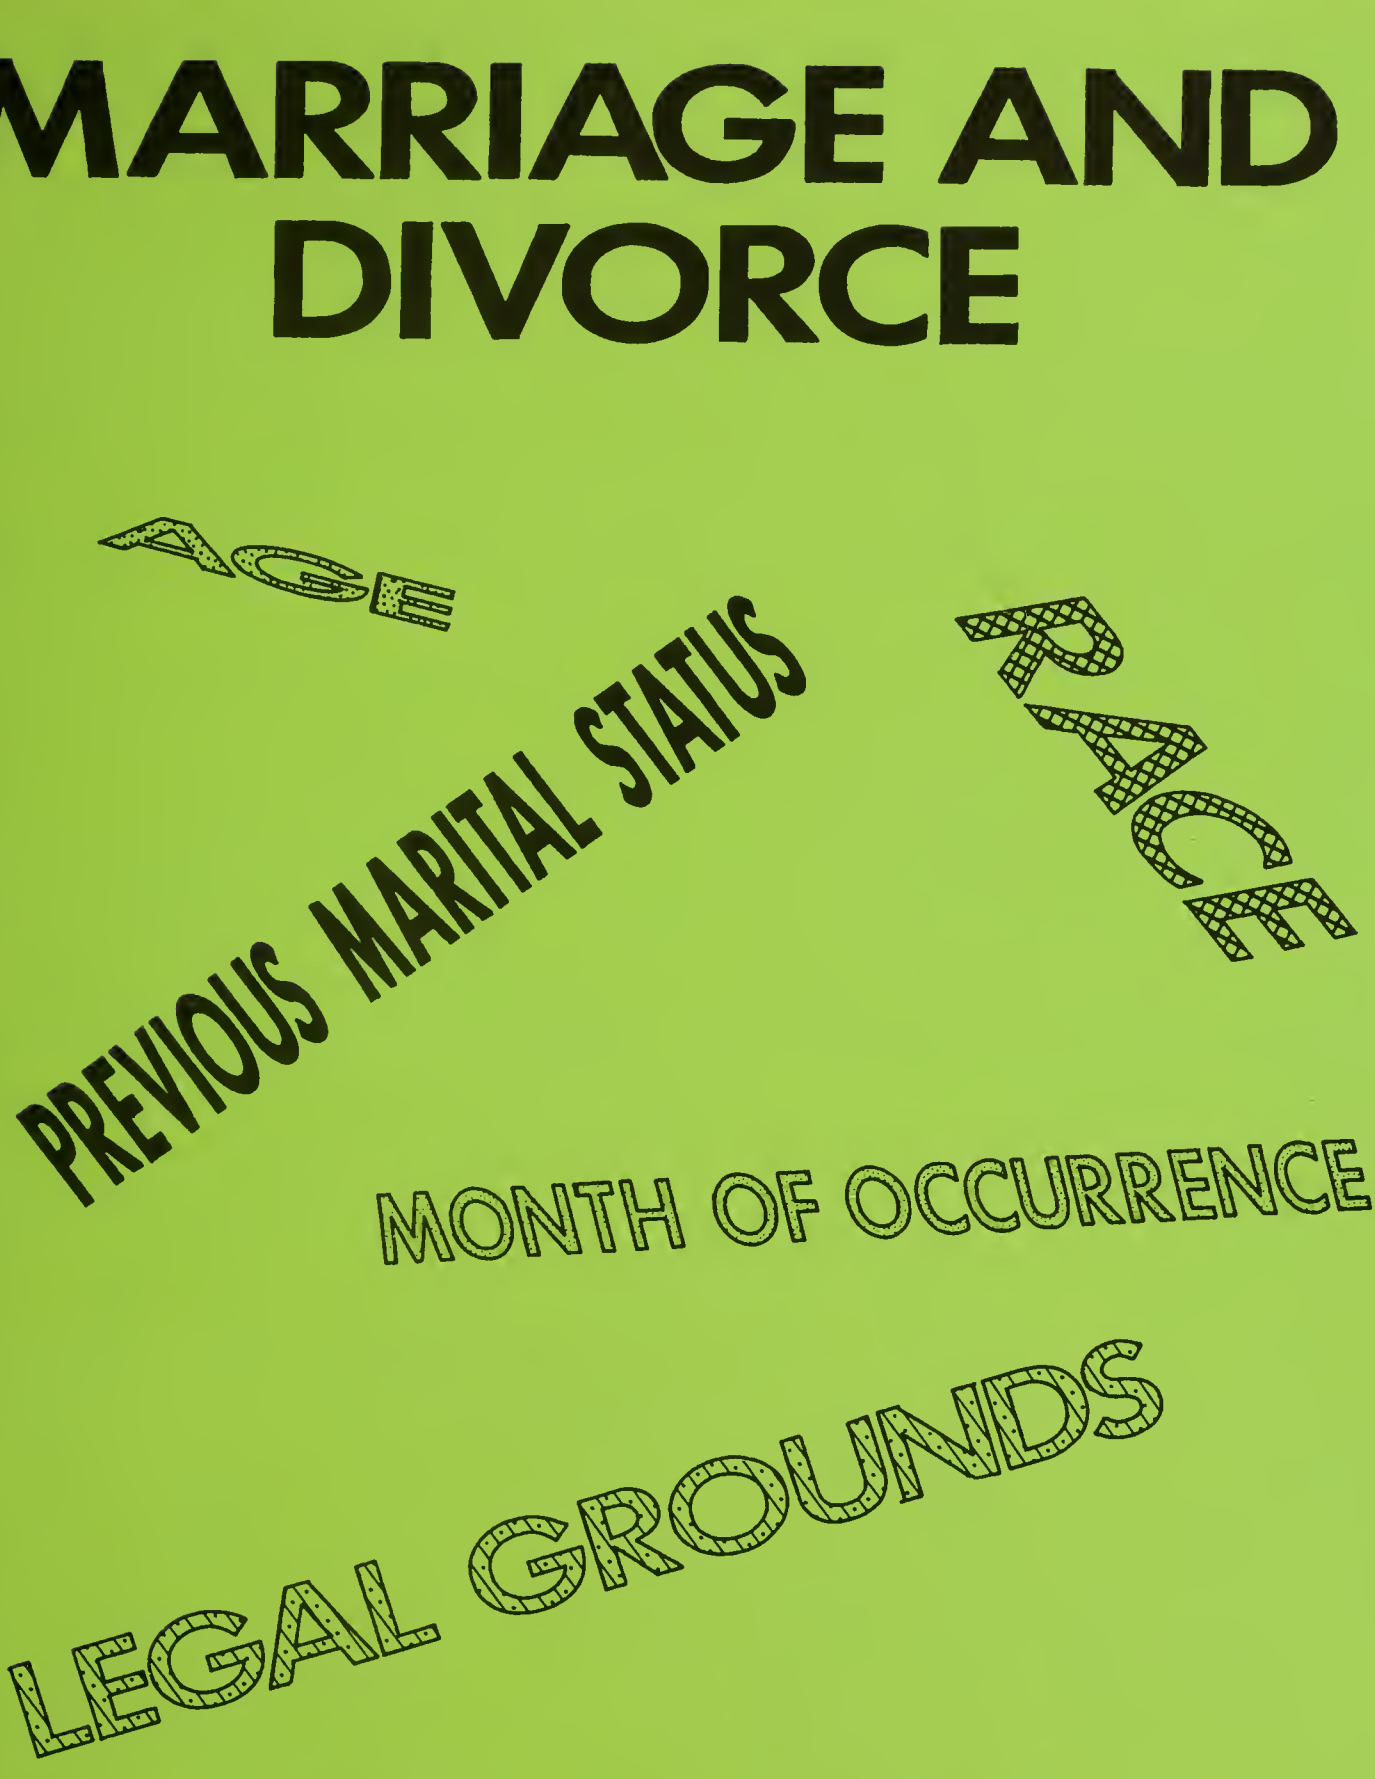

CHART 5

MARRIAGE RATES: Montana & U.S., 1944-78

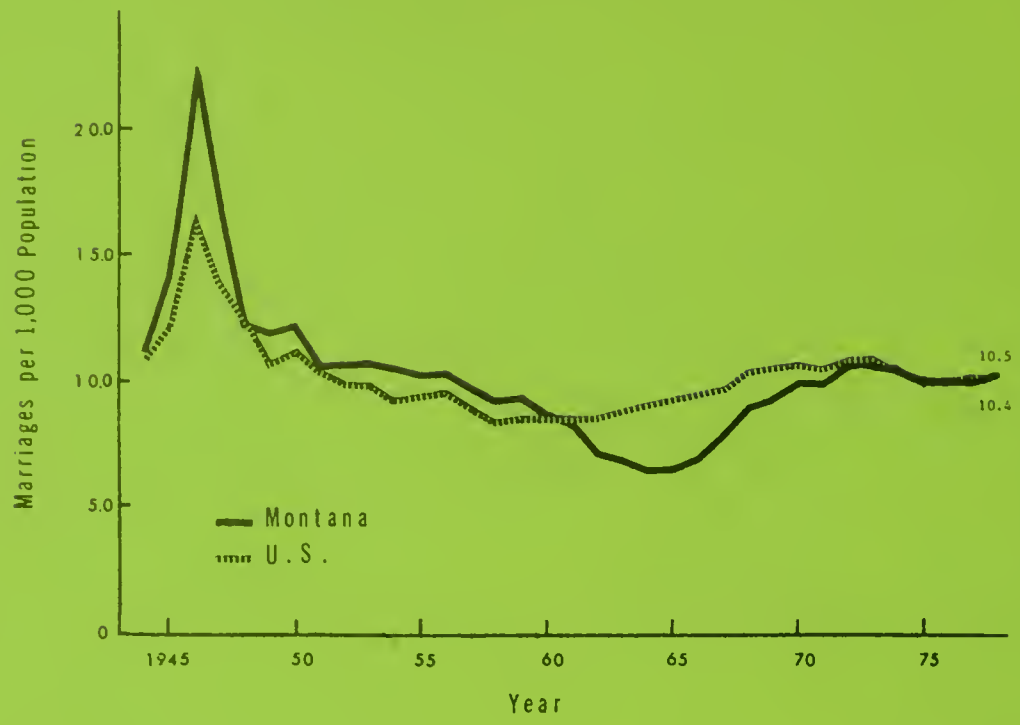

CHART 6

DIVORCE RATES: Montana & U.S., 1944-78

MARRIAGES

Marriage was popular in Montana in 1978. The number of marriages performed in Montana was 8,136, the highest number since 1947. The marriage rate was 10.4 per 1,000 estimated population, a 5.1 percent increase over the 1977 rate (9.9).

In approximately 40 percent of all marriages, both the bride and the groom were in the age group 20-24. The number of brides between the ages of 15 and 29 was 6,646 or 81.7 percent of all women married in 1978. The number of grooms in that same age bracket was 5,925 or 72.8 percent of all men married in 1978.

For persons previously widowed, the highest number of marriages occurred in the age group 60-64 for both women and men. Among those previously divorced, the highest number of marriages occurred in the age group 25-29 for both women and men.

Of the 8,136 marriages in 1978, 4,675 or 57.5 percent were first marriages for both the bride and groom. At the beginning of the decade, the proportion for the group with that marital status was 70.3. The proportion of first marriages declined each year since 1970.

MARITAL TERMINATIONS

There were 4,877 marital terminations (dissolutions of marriage and declaration of invalidity decrees) reported in Montana in 1978. Prior to 1976, dissolutions of marriage were reported as divorce, and an invalid marriage as an annulment. In this narrative the term "divorce" is used interchangeably with the term "marital termination."

The number of divorces has fluctuated very little in the past three years. The mean number for the three years was 4,847 per year. The total number of divorces in 1978 increased by 64 over the 4,813 reported in 1977. The divorce rate has remained the same between

6.2 and 6.4 per 1,000 population during the last three years.

The median duration of marriage for divorces occurring in 1978 was 5.3 years. The figure was the longest such recorded during the decade of the 1970's.

The median age at time of divorce was 31.9 years for divorced husbands and 29.2 years for divorced wives. Comparable median-age figures for 1977 were 31.0 years and 28.4 years respectively.

The total number of children under 18 years of age involved in marital terminations was 5,164 or 1.06 children per divorce, compared to 0.99 in 1977.

In 1978 more husbands were terminating their marriages for the first time (3,290 - 68.1 percent) than were wives (3,116 - 64.4 percent).

The proportions for the number of divorces that dissolved the second and third marriages were similar to each other. The percentages were 22.7 and 6.6 for second and third marriages for divorcing husbands and 22.4 and 6.8 respectively for divorcing wives. Divorcing couples terminating what was a first marriage for each partner numbered 2,821 in 1978. For those couples terminating their second marriage, the count decreased to 508.

Revised forms for reporting marital terminations were introduced in 1978. A new education item was completed on 94.5 percent of all marital terminations reported. This was used to compare the education level of divorced couples. Divorced wives had more years of education than divorced husbands, except in the categories "16 years" and "17 or more years" of education.

COUNTY SUMMARIES

The following table shows summary data for the 56 Montana counties. State figures are shown in the left-hand column on each page for convenience in reference.

The ten leading causes of death shown in the table represent the experience of the entire State. An individual county may have other causes of death which should appear among the top ten. In addition, the rank order of causes for a given county may be different than that for the State.

Rates for live births and deaths are not shown by sex for years other than years in which a federal census is taken. Reason: population estimates for intercensal years do not provide data by sex.

ADDITIONAL TABULATIONS

As stated in the introduction to this report, the information published here is limited to that felt to be of general interest. Tabulations which are produced on an annual basis, but which are not included in this report are listed below. The list is arranged by type of event and by the amount of geographic detail available.

Tabulations can also be produced to satisfy individual requests. In such instances, the requestor may be asked to reimburse the Bureau for production costs. Uncomplicated tabulations can be produced utilizing a card counting sorter. Involved tabulations require computer utilization and involve programming costs and computer charges. Beyond this, the production of special tabulations is subject to the availability of personnel and must not violate the policy of the Montana Board of Health and Environmental Sciences that all records and information concerning individuals received in the offices of the Department are confidential. This is not usually a concern in reports of a statistical or tabular nature in which identification of the individual does not appear.
